TITLE:

Investigation of stripping and elastic scattering of  
deuterons from the  $C^{12}$  nucleus

PERIODICAL:

Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 43,  
no. 1(7), 1962, 8-10

TEXT: The article bases on previous publications (S. Butler. Yadernyye  
reaktsii sryva, IIL, 1960. W. Tobocman. Phys. Rev., 115, 98, 1959.  
D. Robson. Nucl. Phys., 22, 1, 1961). Simultaneous measurements were  
made of the angular distributions of deuterons elastically scattered from  
 $C^{12}$  and protons produced by the reaction  $C^{12}(d,p)C^{13}$  ( $C^{13}$  in the ground  
state and first excited state with an energy of 3.09 Mev). The deuteron  
beam (6.60 Mev) was extracted from a cyclotron (V. F. Litvin. Tr. RIAN,  
9, 141, 1959. Yu. A. Nemilov, V. F. Litvin. PTE, 2, 32, 1960) and shot  
upon a  $\sim 2$  mg/cm<sup>2</sup> thick pure carbon target. The angular distributions  
were measured in a multi-channel magnetic analyzer. Theory and experiment

Inst : Sverdlovsk Agricultural Institute

Title : Experimental Uses of Diatomite in Veterinary Surgery.

Orig Pub : Tr. Sverdl. s.-kh. in-ta, 1957, 257-264.'

Abstract : Diatomite (light silt type porous soil of mountainous origin, consisting of amorphous silica, abstractor's note) possesses great adsorbing capacity. Thus, when used for treating wounds, it speeds up processes of self-purification and regeneration considerably. Because of its ozonizing properties, diatomite may be successfully used in treating putrescent processes. It is particularly effective in the treatment time by 5-9 days. Diatomite is available in the form of powder or ointment, and is used in wound packs and surgical dressings. When diatomite is used, expenditures for treating of animals become lowered. -- I. I. Magda.

CA ZHEREBTSOV, P. I.

Preventing rupture and deformation of blast-furnace shells. A. N. Red'ko and P. I. Zherebtsov. *Shtal* 6, 422-6 (1948).--A compressible and gas-impermeable material is suggested as packing between the lining and shell of a blast furnace for the purpose of preventing rupture or deformation of the shell occasioned by radial expansion of the lining particularly where Zn-contg. ores are smelted. A no. of materials (granulated slag, coke breeze, brickbats, diatomaceous earth, asbestos, etc.) were investigated. The best was found to be a mixt. of asbestine and tar. The latter is to prevent the asbestos from being blown out. The asbestine-tar mixt. should be used in that part of the shaft between the upper bosh line and the first rings of the throat. From there on asbestine alone is preferable. A new mixt. consisting of granulated slag 50 and asbestos 50% is being tried. M. Hosen

TITLE: Adder for recording systems of analyzers with ferrite core memories

CITED SOURCE: Tr. 5-y Nauchno-tekhn. konferentsii po yadern. radio-elektronike. T. 2. Ch. 1. M., Gosatomizdat, 1963, 155-161

TOPIC TAGS: adder, recording system, analyzer, ferrite core memory

TRANSLATION: In an analyzer recording system the adder adds units to the numerical output from the matrix and controls the digit currents when numbers are recorded in the matrix. The adder is used for data printout, for output to external units, as well as for visual display on a CRT. Circuits and operating characteristics are given for experimental binary and decimal adders capable of performing the indicated operations. Magnetic core elements type K-222 are used in the gate control circuits as well as D9D diodes. Type P26B transistors are used in the interrogation pulse and gating current generators. The circuits are

Card 1/2

ACCESSION NR: AR4020786

simple, are easily calculated and adjusted, and operate stably even when the supply voltage varies by  $\pm 25\%$  and the ambient temperature ranges between  $+5$  to  $50$  C. Orig. art. has 4 figs. and 2 refs. G. K.
